PUSH OR PULL LATERAL SYSTEM NAVIGATES 90° ELBOW

THE *Infrastructure* LATERAL POINT REPAIR SYSTEM

is a cutting edge innovation that can be pushed or pulled through a 4" or larger cleanout for a truly trenchless lateral repair. Our liners are sewn together with patented melt away strings and pop open Velcro straps to securely hold them in place on the carrier or bladder while navigating through even a 90°, 4" elbow. This easy to use ambient cure, two part, no shrink or creep, epoxy system comes in a complete kit to give customers a fast and effective repair for cracked or even a missing piece of lateral pipe. With summer and winter formulations repairs can be done at any time. Tests prove it is as strong as the host pipe and a permanent repair with a 100-year life certification. Contact us for information on how you can become an Infrastructure Lateral System Installer today.
